**RIASSUNTO.** Sono pubblicati i dati orari del livello del mare ed i dati medi ed estremi giornalieri del livello del mare, della temperatura dell'aria e della temperatura del mare (in superficie ed a 2 m di profondità) rilevati alla stazione mareografica di Trieste - Porto Lido durante il 1996.

## La stazione mareografica

La stazione mareografica di Trieste - Porto Lido (45° 38' 55" N, 13° 45' 18" E ; fig. 1, 2) è stata installata nel 1995 presso la sede a mare dell'Istituto Tecnico Nautico di Trieste (Stravisi e Purga, 1997).

I sensori impiegati sono elencati nella tab. 1. Il sensore di livello Micros SLU1 misura con continuità la distanza  $S_0$  dalla quota  $S_0$  al livello del mare nel tubo idrometrico. In base alle misure di controllo effettuate in un tubo secondario con riferimento alla piastrina mareografica CM2, è stata ricavata per il 1996 la seguente formula di calibrazione (Stravisi e Purga, 1997) :

$$S = 0.9870 S_0 - 0.17 (\theta_s - \theta) + 6.9 \pm 0.3 \text{ cm} ; \quad (1)$$

le temperature del sensore  $\theta_s$  e dell'aria  $\theta$  sono espresse in gradi Celsius. La (1) corregge anche gli errori di scala dell'elettronica e della guida d'onda. I dati di livello  $\eta$  sono riferiti al "piano zero" (Stravisi e Purga, 1997) :

$$P_0 = \text{ZIT} + 167 \text{ cm} = \text{CO39} - 66.315 \text{ cm} = \text{IGM} + 0.101 \text{ cm} . \quad (2)$$

Il livello del mare corrispondente alla distanza (1) e riferito a  $P_0$  risulta dunque dato da :

$$\eta = (S_0 - P_0) - S = 450.8 \text{ cm} - S . \quad (3)$$

I caposaldi e le corrispondenti quote sono elencati nella tab. 2.

**Tab. 2.-** Principali caposaldi e piani di riferimento. Livellazione del : 1967 <sup>(1)</sup>, 1996 <sup>(2)</sup>.

La temperatura del mare è misurata a 15 m dalla riva alla superficie ( $\theta_0$ ) ed a 2 m di profondità ( $\theta_2$ ). I sensori di temperatura e umidità dell'aria sono posti sul palo di sostegno del mareografo. Il barometro è collocato internamente alla centralina di acquisizione dati Micros. I dati di pressione e umidità dell'aria rilevati presso la stazione mareografica non sono qui pubblicati; si faccia riferimento ai corrispondenti dati della stazione meteorologica di Trieste-ITN (Stravisi 1997a,b; Stravisi e Badina, 1997).

I sensori sono interrogati con continuità dalla centralina di acquisizione dati Micros; ogni 10 minuti vengono memorizzati sul cassetto di memoria a stato solido CBM/1 i valori medi della pressione, della temperatura (dell'aria, del mare in superficie, del mare a 2 m, del sensore di livello e del sensore di pressione) e dell'umidità relativa. Sono memorizzati infine il livello medio dell'ultimo minuto ed i due livelli estremi nell'intervallo, con gli istanti (il minuto) in cui si sono verificati.

## Tabelle e grafici

**Tabelle mensili con i dati orari di livello.** L'ora riportata nella prima riga corrisponde al *tempo medio dell'Europa centrale* (TMEC = GMT + 1 h). I dati di livello (3), espressi in millimetri e riferiti al *piano zero* (2), sono i valori medi dell'ultimo minuto :1 = [00:59-01:00], ... 24 = [23:59-24:00]. L'ultima riga riporta il ciclo giornaliero medio del mese.

**Tabelle mensili con i dati giornalieri medi ed estremi del livello.** La giornata inizia alle ore 00:00 TMEC. Le medie giornaliere (med) sono calcolate con i 144 valori registrati ad intervalli di 10 min; sono inoltre riportati i livelli giornalieri estremi (min, max) con i corrispondenti istanti (*ora*) e l'escursione giornaliera (esc). I livelli, espressi in centimetri, sono riferiti a P<sub>0</sub>.

**Tabelle mensili con i dati giornalieri medi ed estremi delle temperature.** Riportano i dati giornalieri medi (med) ed estremi (min, max) della temperatura dell'aria e del mare e le corrispondenti escursioni (esc).

**Riassunto annuale.** La tabella riporta, per il livello del mare e per le temperature, i valori medi mensili (med), le medie mensili degli estremi giornalieri (min, max), le medie mensili delle escursioni giornaliere (esc) e gli estremi assoluti del mese (MIN, MAX).

**Grafici.** Rappresentano la serie temporale completa del livello del mare (passo 10 min) e la corrispondente *marea meteorologica* (differenza tra il livello osservato e la marea astronomica). La marea astronomica è stata calcolata come somma di sette componenti armoniche ( $m=1,7$ ) :

$$\eta_m = f_m(t) H_m \cos(V_m(t) + u_m(t) - g_m) ;$$

i fattori nodali  $f$  e gli argomenti  $V+u$  (Stravisi, 1989) sono stati calcolati in funzione del tempo senza la consueta approssimazione lineare. Le costanti armoniche sono le medie dei valori relativi agli anni 1941-1961 e 1975-1996 ottenuti con il metodo dei minimi quadrati (tab. 3).

	<b>M<sub>2</sub></b>	<b>S<sub>2</sub></b>	<b>N<sub>2</sub></b>	<b>K<sub>2</sub></b>	<b>K<sub>1</sub></b>	<b>O<sub>1</sub></b>	<b>P<sub>1</sub></b>
<i>H</i> /cm	26.7	15.9	4.5	4.8	18.0	5.3	6.0
<i>g</i>	277.0°	284.9°	275.7°	280.2°	71.3°	60.8°	67.3°

**Tab. 3.-** Costanti armoniche di Trieste.

Gli ultimi due grafici riportano, per tutto l'anno, l'andamento dei valori medi giornalieri della pressione atmosferica al livello del mare, della marea meteorologica, della temperatura dell'aria e del mare a 2 m e della differenza tra la temperatura del mare in superficie e a 2 m di profondità. Livello e pressione sono ben correlati ; la pendenza della retta di regressione è di -1.3 cm/hPa.
